

TURLI CHEGARALANISHLI HOL UCHUN II STRATEGIYANING QURILISHI HAQIDA

Abduraximova Zulayxo Ikromjon qizi
Turan International University o‘qituvchisi
zulayxoabduraximova96@gmail.com

ANNOTATSIYA

Ushbu maqolada II strategiyaning geometrik chegaralanish, integro – geometrik chegaralanishli holatlar uchun qurilishi yoritilgan. II strategiyaning qurilishi turli chegaralanishli hol uchun quvish – qochish maslasining yechimlariga uzviy bog‘liqligi isbotlangan.

Kalit so‘zlar: II strategiya, geometrik chegaralanish, integro – geometrik chegaralanish.

О ПОСТРОЕНИИ II – СТАТЕГИИ ДЛЯ РАЗЛИЧНЫХ ГРАНИЧНЫХ СЛУЧАЕВ

АННОТАЦИЯ

В статье описано построение II стратегии для геометрически ограниченных, интегро-геометрически ограниченных случаев. Доказано, что построение II-стратегии неразрывно связано с решением задачи погони-убегания для различных предельных случаев.

Ключевые слова: II стратегии, геометрическое ограничение, интегро - геометрическое ограничение

ON THE CONSTRUCTION OF II STRATEGY FOR DIFFERENT BOUNDARY CASES

ABSTRACT

This article describes the construction of strategy P for geometric bounded, integro-geometrically bounded cases. It has been proved that the construction of P strategy is inextricably linked to the solutions of the chase-escape problem for different limiting cases.

Keywords: II strategy, geometric limitation, integro - geometric limitation.

Differensial o‘yinlar nazariyasida chegaralanishlar uchun II strategiya muhim ahamiyatga ega. Har bir chegaralanish uchun alohida II strategiyalar mavjud. Quyida ularni har birini ko‘rib chiqamiz.

Fazoda P va E obyekt harakatlanyapti

$$P: \begin{cases} \dot{x} = U \\ x(0) = x_0 \end{cases} \quad (1)$$

$$E: \begin{cases} \dot{y} = V \\ y(0) = y_0 \end{cases} \quad (2)$$

1. Geometrik chegaralanish :

$$a) |U| \leq \alpha; |V| \leq \beta; |U| = \sqrt{U_1^2 + \dots + U_n^2}; |V| = \sqrt{V_1^2 + \dots + V_n^2}$$

$$b) U = (U_1; U_2) \rightarrow |U_1| \leq \alpha_1, |U_2| \leq \alpha_2$$

$$V = (V_1; V_2) \rightarrow |V_1| \leq \beta_1, |V_2| \leq \beta_2$$

Π strategiya : $U(v) = v \cdot \lambda_G(v) \xi_0$, $\xi_0 = \frac{x_0 - y_0}{|x_0 - y_0|}$ bu yerda

$$\lambda_G(v) = \langle v, \xi_0 \rangle + \sqrt{\langle v, \xi_0 \rangle^2 + \alpha^2 - |v|^2}$$

$\alpha > \beta$ da tutish masalasi yechiladi; $\alpha \leq \beta$ da qochish masalasi yechiladi.

2. Integro – geometrik chegaralanishli xol :

$$a) \int_0^\infty |U(s)|^2 ds \leq \rho_0,$$

(3)

$$|v| \leq \beta$$

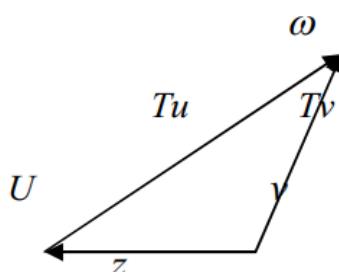

(4)

$$b) \int_0^t |U_1(s)|^2 ds \leq \rho_{10}, \int_0^t |U_2(s)|^2 ds \leq \rho_{20}$$

$$|v_1| \leq \beta_1, \quad |v_2| \leq \beta_2$$

$$P: \dot{x} = U(t), x(0) = x_0 \rightarrow x(t) = x_0 + \int_0^t U(s) ds$$

$$E: \dot{y} = V(t), y(0) = y_0 \rightarrow y(t) = y_0 + \int_0^t V(s) ds$$

$$\text{Tutish masalasi: } \forall t^*: x(t^*) = y(t^*) \quad (5)$$

$$\text{Qochish masalasi: } x(t) \neq y(t), t \geq 0 \quad (6)$$

$$z + Tu = Tv, Tu = Tv - z, u = v - \frac{z}{T} \quad (7)$$

$$\int_0^T |U|^2 ds = \rho, T |U|^2 = \rho, |U|^2 = \frac{\rho}{T} \quad (8)$$

Quyidagicha belgilash kiritib olamiz : $\frac{|z|}{T} = \lambda \Rightarrow U = v - \lambda \xi, |U|^2 = \lambda \frac{\rho}{|z|}$

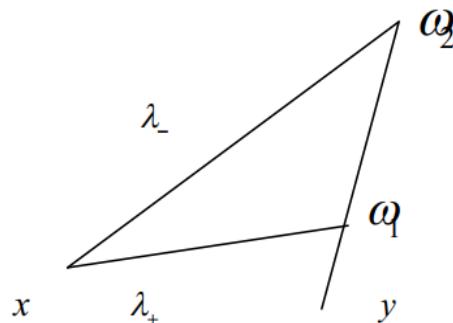

$$\begin{cases} |U|^2 = |v|^2 - 2\lambda \langle v, \xi \rangle + \lambda^2 \\ \lambda \frac{\rho}{|z|} = |v|^2 - 2\lambda \langle v, \xi \rangle + \lambda^2 \end{cases} \Rightarrow \lambda^2 - 2\lambda \left(\frac{\rho}{2|z|} + \langle v, \xi \rangle \right) + |v|^2 = 0 \quad (9)$$

$$\lambda_{1,2} = \frac{\rho}{2|z|} + \langle v, \xi \rangle \pm \sqrt{\left(\frac{\rho}{2|z|} + \langle v, \xi \rangle \right)^2 - |v|^2} \quad (10)$$

λ_1 va λ_2 ham musbat . Savol tuo‘iladi qaysi λ ni olamiz ?

$\lambda_1, \lambda_2 > 0$ agar , $\frac{\rho}{2|z|} + \langle v, \xi \rangle > 0$ bo‘lsa yechim mavjud bo‘lishi uchun ildiz osti

aniqlangan bo‘lishi kerak ya’ni $D = \left\{ (\rho, z, v) : \left(\frac{\rho}{2|z|} + \langle v, \xi \rangle \right)^2 - |v|^2 \geq 0 \right\}$

Integro – geometrik holda quvlovchini parallel yaqinlashtirish orqali (ω_1, ω_2) oraliqda tutish mumkin bo‘lar ekan . Biz bitta quvlovchi bitta qochuvchi bo‘lgan holda ko‘ramiz ya’ni λ_+ ni olamiz . Shuning uchun (10) ga yechim sifatida λ_1 ni tanlaymiz . Natijada hal qiluvchi funksiya deb,

$$\lambda(\rho, z, v) = \frac{\rho}{2|z|} + \langle v, \xi \rangle + \sqrt{\left(\frac{\rho}{2|z|} + \langle v, \xi \rangle \right)^2 - |v|^2} \quad (11)$$

funksiyani olamiz . n o‘lchovli fazoda $2n+1$ ta yechimi bor. (11)- funksiyani

aniqlanish sohasini tahlil qilamiz $D = \left\{ (\rho, z, v) : \left(\frac{\rho}{2|z|} + \langle v, \xi \rangle \right)^2 - |v|^2 \geq 0 \right\}$

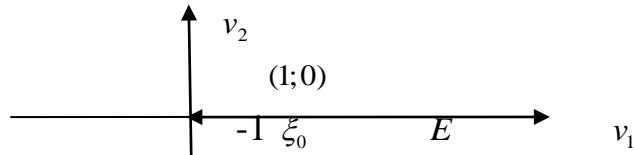

$$\left(\frac{\rho}{2|z|} + \langle v, \xi \rangle + |v|\right)\left(\frac{\rho}{2|z|} + \langle v, \xi \rangle - |v|\right) \geq 0 \text{ demak ,}$$

$$\frac{\rho}{2|z|} + \langle v, \xi \rangle - |v| \geq 0 \quad (12)$$

bo‘lishi kerak . (12) tengsizlikning geometrik mohiyati (v ga nisbatan):

$$a^2 = \frac{\rho}{2|z|}, \quad a^2 + v_1\xi_1 + \dots + v_n\xi_n - \sqrt{v_1^2 + \dots + v_n^2} \geq 0 \text{ figura hosil bo‘ladi .}$$

Soddalashtirish uchun tekislikda ko‘raylik . $a^2 + v_1\xi_1 + v_2\xi_2 - \sqrt{v_1^2 + v_2^2} \geq 0$

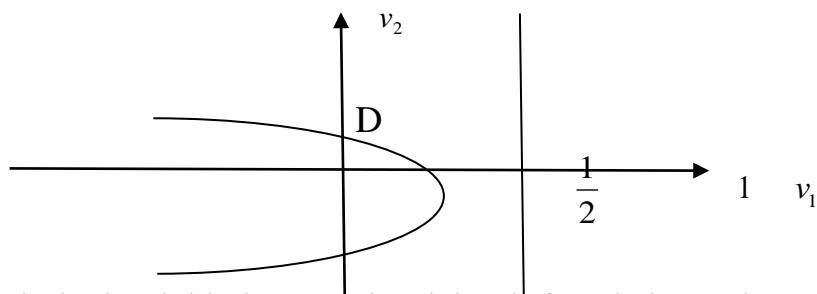

$$\xi_0 = \frac{x_0 - y_0}{|x_0 - y_0|}, \quad x_0 = (0;0), \quad y_0 = (1;0); \quad \xi_0(-1;0), \quad \xi_1 = -1, \quad \xi_2 = 0$$

$$a^2 - v_1 - \sqrt{v_1^2 + v_2^2} \geq 0, \quad a^2 \geq v_1 + \sqrt{v_1^2 + v_2^2} \geq 0, \quad a = 1 \text{ desak ,}$$

$$v_1 + \sqrt{v_1^2 + v_2^2} \leq 1, \quad \sqrt{v_1^2 + v_2^2} \leq 1 - v_1$$

$$1 - 2v_1 + v_1^2 \geq v_1^2 + v_2^2, \quad 1 - 2v_1 \geq v_2^2, \quad v_1 \leq \frac{1 - v_2^2}{2}$$

D sohamiz parabolaning ichi ekan . Uch o‘lchovli fazoda ko‘rsak , paraboloid bo‘lib qolar ekan . Agar $a \neq 1$ bo‘lsa uchi $\frac{a}{2}$ da bo‘lar ekan tekislikda .

$$\xi_0(-1,0,0); \quad a^2 - v_1 - \sqrt{v_1^2 + v_2^2 + v_3^2} \geq 0, \quad a^2 - v_1 \geq \sqrt{v_1^2 + v_2^2 + v_3^2}$$

$$a^4 - 2a^2v_1 + v_1^2 \geq v_1^2 + v_2^2 + v_3^2, \quad a^4 - 2a^2v_1 \geq v_2^2 + v_3^2, \quad v_1 \leq \frac{a^4}{2a^2} - \frac{v_2^2 + v_3^2}{2a^2}, \quad v_1 \leq \frac{a^2}{2} - \frac{v_2^2 + v_3^2}{2a^2}$$

$\beta \leq \frac{a^2}{2} = \frac{\rho}{4|z|} \Rightarrow \rho \geq 4\beta|z|$. Demak , xulosa (11) $\lambda(\rho, z, v)$ funksiya $\rho \geq 4\beta|z|$ bo‘lganda $\forall |v| \leq \beta$ uchun aniqlangan .

(11) ko‘rinishni yuqoridagi $U = v - \lambda\xi, |U|^2 = \lambda \frac{\rho}{|z|}$ tenglikka olib kelib qo‘yamiz va quyidagi strategiyani hosil qilamiz :

$$\begin{cases} U(\rho, z, v) = v - \lambda(\rho, z, v)\xi \\ |U(\rho, z, v)|^2 = \lambda(\rho, z, v) \frac{\rho}{|z|} \end{cases} \quad (13)$$

(1) va (2) tenglamadan quyidagi tenglamani hosil qilamiz

$$\begin{cases} \dot{z} = U - v \\ z(0) = z_0 \end{cases} \quad (14)$$

bu yerda $z = x - y, \dot{x} = U; z_0 = x_0 - y_0, \dot{y} = v; \dot{x} - \dot{y} = U - v$

(14) ko‘rinishdagi U ni o‘rniga (13) ni 1-qatorini qo‘yamiz natijada :

$$\begin{cases} \dot{z} = -\lambda(\rho, z, v)\xi \\ z(0) = z_0 \end{cases} \quad (15)$$

$$\rho(t) = \rho_0 - \int_0^t |U(s)|^2 ds \quad (16)$$

(16) tenglamaga $|U|^2$ ni o‘rniga (13) ni 2-qatorini qo‘yamiz

$\rho(t) = \rho_0 - \int_0^t \lambda(\rho(s), z(s), v(s)) \frac{\rho(s)}{|z(s)|} ds$ tenglikni hosil qilamiz . Endi har ikki tomondan hosila olaylik

$$\begin{cases} \dot{\rho}(t) = -\lambda(\rho, z, v) \frac{\rho}{|z|} \\ \rho(0) = \rho_0 \end{cases} \quad (17)$$

(15) va (17) lardan quyidagi natijaga ega bo‘lamiz

$$\begin{cases} \dot{z} = -\lambda(\rho(t), z(t), v(t)) \frac{z(t)}{|z(t)|} \\ \dot{\rho} = -\lambda(\rho(t), z(t), v(t)) \frac{\rho(t)}{|z(t)|} \\ z(0) = z_0, \rho(0) = \rho_0 \end{cases}$$

(18)

(18) dan (ρ, z) ga nisbatan differensial tenglamalar sistemasi hosil bo‘lishi kelib chiqdi.

(18) sistema nochiziqli differensial sistema . Agar $z \neq 0$ bo‘lsa bu sistemaning o‘ng tomonidagi funksiya $\rho \geq 4\beta|z|$ shartda uzlusiz ((ρ, z) ga nisbatan) . Funksiya t ga nisbatan esa o‘lchovli funksiya (ya’ni Karatedore shartlari bajarilyapti) deyiladi. Karatedore sharti bo‘lishi uchun , Karatedore tenglamasining o‘ng tomoni z bo‘yicha Lipshist shartini qanoatlantirishi kerak ya’ni

$$|f(z_1, t) - f(z_2, t)| \leq L |z_1 - z_2| \quad (19)$$

(18) tenglamaning o‘ng tomonidagi funksiyalar (ρ, z) bo‘yicha $z \neq 0$ holda Karatedore shartlari o‘rinli . Shuning uchun (18) sistemani yagona yechimi mavjud bo‘ladi . (18) tenglamadan quyidagicha almashtirish hosil qilamiz

$$\begin{cases} \dot{z}_1 = -\lambda(\rho(t), z(t), v(t)) \frac{z_1(t)}{|z(t)|} \\ \dot{z}_2 = -\lambda(\rho(t), z(t), v(t)) \frac{z_2(t)}{|z(t)|} \\ \dots \\ \dot{z}_n = -\lambda(\rho(t), z(t), v(t)) \frac{z_n(t)}{|z(t)|} \end{cases} \Rightarrow \begin{cases} \frac{\dot{z}_1}{z_1} = -\lambda(\rho(t), z(t), v(t)) \frac{1}{|z(t)|} \\ \frac{\dot{z}_2}{z_2} = -\lambda(\rho(t), z(t), v(t)) \frac{1}{|z(t)|} \\ \dots \\ \frac{\dot{z}_n}{z_n} = -\lambda(\rho(t), z(t), v(t)) \frac{1}{|z(t)|} \end{cases}$$

endi integrallasak ,

$$\ln z_i \Big|_0^t = - \int_0^t \lambda(\rho(s), z(s), v(s)) \frac{1}{|z(s)|} ds; z_i(s) = z_i(0) e^{- \int_0^s \lambda(\rho(t), z(t), v(t)) \frac{1}{|z(t)|} ds}, i = \overline{1, n}$$

$$e^{-\int_0^t \lambda(\rho(s), z(s), v(s)) \frac{1}{|z(s)|} ds} = h(t) \text{ deb olsak ,}$$

$$z(t) = z_0 h(t) \quad (20)$$

hosil bo‘ladi . Xuddi shu kabi ,

$$\begin{cases} \rho(t) = \rho_0 h(t) \\ z(t) = z_0 h(t) \end{cases} \quad (21)$$

bu yerda $h(t) = h(z, \rho, v, t)$. (21) ni (11) ga olib borib qo‘yaylik

$$\lambda(\rho, z, v) = \frac{\rho}{2|z|} + \langle v, \xi \rangle + \sqrt{\left(\frac{\rho}{2|z|} + \langle v, \xi \rangle\right)^2 - |v|^2} = \frac{\rho_0 h}{2|z_0| h} + \left\langle v, \frac{z_0 h}{|z_0| h} \right\rangle + \sqrt{\left(\frac{\rho_0}{2|z_0|} + \langle v, \xi_0 \rangle\right)^2 - |v|^2} = \lambda(\rho_0, z_0, v)$$

Demak , boshlano‘ich holatdagi (ρ_0, z_0) ni bilsak bo‘ldi ekan .

Ta’rif : Integro –geometrik differensial o‘yinda Π strategiya deb , quyidagi funksiyaga aytamiz

$$U(v) = v - \lambda_{IG}(v) \xi_0 \quad (22)$$

$$\text{bu yerda } \lambda_{IG}(v) = \frac{\rho_0}{2|z_0|} + \langle v, \xi_0 \rangle + \sqrt{\left(\frac{\rho_0}{2|z_0|} + \langle v, \xi_0 \rangle\right)^2 - |v|^2}$$

Mavzu bo‘yicha tarixiy ma’lumot : Strategiyalar quvish masalasi qadimdan olimlarni qiziqtirgan . Eramizdan 2000 yil avval Xitoy qo‘lyozmalarida “Burgut va O‘lja masalasi “ o‘rganilgan bunda burgut o‘z o‘ljasini izma –iz quvish strategiyasi orqali harakatlanib ushslash masalasi ko‘rilgan . Lekin matematika rivoji u davrda bu masalani yechishga yetarli bo‘lmagan . 1732- yil fransus gidrogrifi va matematigi Bagauer “ Tulki va Quyon “ masalasini yechadi . Bunda quyin ma’lim to‘o‘ri chiziq bo‘yicha qochib borganda tulki uni izma – iz quvish natijasida qaysi trayektoriya orqali harakat qilishi mumkinligi mα asaasi yechildi . Bu masala amerikalik olim Lokning “ Zambaraklarni boshqarish “ kitobida bafurcha tahlil qilinib yechimlari keltirilgan .
